

SRM 3000 Selective Radiation Meter

- ◆ Complete Solution for Selective Measurement of RF and Microwave Electromagnetic Fields
- ◆ Isotropic and Single-Axis Measurements from 100 kHz to 3 GHz
- ◆ Excellent Immunity for Operation in High Field Strengths
- ◆ Automatic Antenna and Cable Detection
- ◆ Results in V/m, A/m, Power Density, or Percentage of Permissible Limit
- ◆ Automatic Correlation of Results with Telecommunication Services (e.g., TETRA, GSM, UMTS) Based on User-Defined Tables
- ◆ Automatic Computation of Contribution of Individual Services to Overall Field Exposure (Safety Evaluation mode)
- ◆ Resolution Bandwidths (RBWs) up to 5 MHz for UMTS and W-CDMA

Features

The Selective Radiation Meter (SRM) is a hand-held selective measuring device for safety analysis of RF and microwave electromagnetic fields. The SRM can be used by broadcasters, radio network operators, measurement service providers and public authorities to selectively measure the field exposure produced by individual telecom services and assess the results in accordance with the applicable standards. Most measurements required in the mobile radio sector can be performed directly using the hand-held device. The SRM immediately evaluates the results on site.

The SRM consists of a basic unit and a measurement antenna. The basic unit contains a spectrum analyzer for the 100 kHz to 3 GHz frequency range. It can be operated using antennas from Narda or in combination with measurement antennas from other manufacturers. The triaxial antenna allows isotropic (non-directional) measurements from 75 MHz to 3 GHz, covering FM radio up to the W-CDMA and UMTS services.

The basic unit and antenna are battery powered, rugged, and easily hand portable, offering all of the functions needed to evaluate, store, and document results without a separate PC. However, when required, results can easily be exported to a PC for long-term storage or further analysis.

Applications

The SRM is a hand-held measuring device that was developed for analyzing safety issues in electromagnetic fields. It includes specially designed modes for safety applications. It can also be used as a conventional RF spectrum analyzer for general field strength measurements. Typical applications are as follows:

COMPARISON MEASUREMENT IN A KNOWN-FIELD ENVIRONMENT

"Site sharing" is the usual situation today: Suppose that several mobile radio service operators have antennas located on a common tower or a roof. The overall electromagnetic radiation exposure from any number of sources needs to remain below a specified limit that usually varies with frequency. The SRM displays the total field exposure and also the contributions of the individual services (absolute value or percentage of permissible limit).

This allows operators, public authorities and measurement service providers to verify directly, on-site, whether the different services comply with emission regulations and if not, to know which operator needs to reduce its output power and by how much.

OVERVIEW MEASUREMENT IN AN UNKNOWN-FIELD ENVIRONMENT

All of the industrialized nations have stipulated emission limits for both working environments and for the general public. Special care is often taken in sensitive areas such as schools and hospitals.

The SRM allows public authorities and measurement service providers to verify whether operators are complying with the applicable limits. With the SRM it is easy to make a fast scan of all the field sources in the frequency range of interest. The SRM is so sensitive that the very weak sources, such as individual mobile radio channels, can be separately evaluated – even inside buildings. An overview measurement is also useful for detecting any unknown sources.

MEASUREMENT OF INDIVIDUAL TELECOM SERVICES

Operators are responsible for the fields produced by their own services. Even in a very complex field environment, and in the vicinity of powerful broadcast signals, the SRM can be used to measure individual transmit channels or frequencies. The device is capable of integrating over its frequency range and displaying the total value (an absolute value). For example, for GSM measurements, the SRM can use a 200 kHz resolution bandwidth (RBW) to measure the field strength of an individual control channel (BCCH) which always transmits at full power and estimates the field emissions which all of the traffic channels (TCH) would produce under full load. For UMTS measurements, the SRM can use a 5 MHz resolution bandwidth to measure an entire frequency block.

The SRM is capable of taking long-term measurements showing how the field strength of a selected frequency varies over time. The peak values can be saved to provide valuable information for service providers and local authorities alike.

Additionally, the SRM can demodulate the pilot channels (P-CPICH) of individual cells of UMTS base stations and extrapolate the "worst case" electromagnetic exposure level from the result

Operation

The SRM's basic unit contains the spectrum analyzer with the RF input unit, measurement/operations processor, input panel and display. All of the functions and parameters can be set directly using softkeys and/or a thumb-wheel. The SRM can also compute results as follows:

- Field strength level or percentage of permissible exposure level
- Single source or single channel

- List of sources or channels
- Contribution from a given telecom service
- Contribution from all services and their percentage of the total field strength

The SRM automatically recognizes the following data:

- **Antenna factors for converting the antenna output voltage into field strength values.** The SRM automatically recognizes the individual correction factors from an EEPROM built into the antenna via a separate control cable. If the antenna is connected to the basic unit via a Narda extension cable, the SRM will also recognize the frequency-dependent loss factors for the cable from an EEPROM in the cable. For antennas and cables from other manufacturers, the user can input the relevant correction factors using the supplied PC software and transfer the data to the SRM via the serial interface. To make measurements, just select the antenna and cable type in the configuration menu.
- **Exposure limits from common safety guidelines and standards.** Exposure limits are stored in the SRM and can be easily selected via a simple menu. Other limits can be transferred to the SRM as an update via the serial interface.
- **Assignment of telecom services to frequency bands.** User-editable tables are provided in the supplied PC software. A service table (e.g., "GSM-900") is a list of individual operators by name along with the upper and lower limits of the assigned frequency band. These lists are transferred to the SRM via the serial interface.

MEASUREMENTS USING NARDA'S TRIAXIAL ANTENNA

Such measurements automatically produce isotropic (i.e., non-directional) results. These measurements can be made in three different ways.

- **Antenna connected directly to the basic unit.** This makes it possible to perform measurements in the entire mobile radio band. The SRM is well suited for use on radio masts and towers where it is difficult to make conventional narrowband measurements. As a true hand-held device, the SRM is relatively easy to use in these awkward environments.
- **Antenna connected to basic unit via cable.** This is useful if you need to take measurements over a given volume to find the location with the highest field strength. It is also possible to hang the basic unit from a belt or harness and hand-carry the antenna.
- **Antenna mounted on a tripod and connected to basic unit via cable.** This arrangement produces the most reliable results since the field being measured is not influenced by the presence of the basic unit or the user.

MEASUREMENTS USING ANTENNAS FROM OTHER MANUFACTURERS

Antennas built by other manufacturers may be used with the SRM. Of course, single-axis antennas will produce directional results. For example, you can connect a directional antenna to the SRM via a cable and carry it in your hand to determine the main direction of radiation or 'main beam' from a source.

The SRM can also measure three axes with a single-axis antenna. To do this, a special apparatus must be used on the tripod to arrange the receiving axis of the antenna in three mutually orthogonal positions in succession. The SRM saves the result for each of the axes and then computes the field strength.

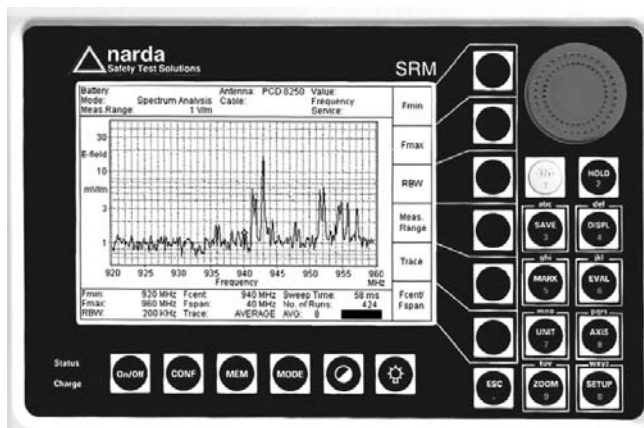

Operating Modes

Since it is built for broad everyday use, the SRM has both general and special modes which are tailored to the main applications.

SPECTRUM ANALYSIS

In multi-frequency environments, the *Spectrum Analysis* mode provides an overview of all frequency components with their field strengths. The user just has to set the desired frequency range. The SRM will only accept values which do not exceed the frequency limits of the connected antenna. The spectrum is clearly displayed, and the markers and zoom function can be used to quickly make a field strength assessment. Peak tables show all field strength values above a certain value along with their frequency.

One special feature of the SRM in this mode is the ability to integrate over a desired frequency range. This allows the user to display the power of a transmit channel with a bandwidth greater than the resolution bandwidth (RBW) of the measurement.

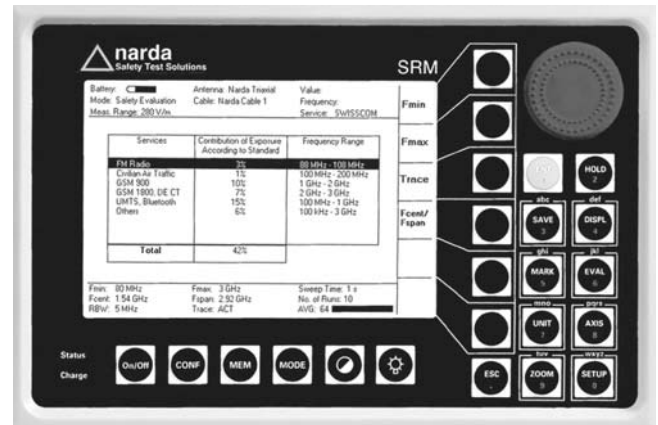

Spectrum Analysis mode is useful for identifying all field sources within the chosen frequency range.

SAFETY EVALUATION

In this mode, the SRM displays the field strength results in tabular format, broken down by the contributions from individual telecom services. The total exposure is also displayed. The frequency bands for individual services can be user-defined. The results can be displayed as a percentage of an exposure limit, or as absolute values in V/m, A/m or W/m² and mW/cm². The *Safety Evaluation* mode provides the user with an immediate overview of contributions from individual services which make up the total field strength level. This is very useful where several operators are sharing an antenna site.

The SRM displays the results as a percentage or as absolute values in V/m, A/m or W/m² and mW/cm² of the given exposure limit. *Safety Evaluation* mode is based on spectrum analysis followed by integration across certain frequency ranges. The measurement process is fully automated. The SRM measures the entire frequency range for all selected services and automatically sets its resolution bandwidth (RBW) to fit the smallest frequency span to be measured. It saves the absolute field strength values from the selective measurements, evaluates the data based on the selected standard, and stores these results also. Integration over the frequency ranges of the individual services provides the individual contributions. The SRM groups together the frequency ranges between

Safety Evaluation mode enables contributions from individual telecom services to be compared with the total field strength value. Here, the results are shown as a percentage of the permissible exposure level.

the selected services as 'Others' and includes them in the overall total result.

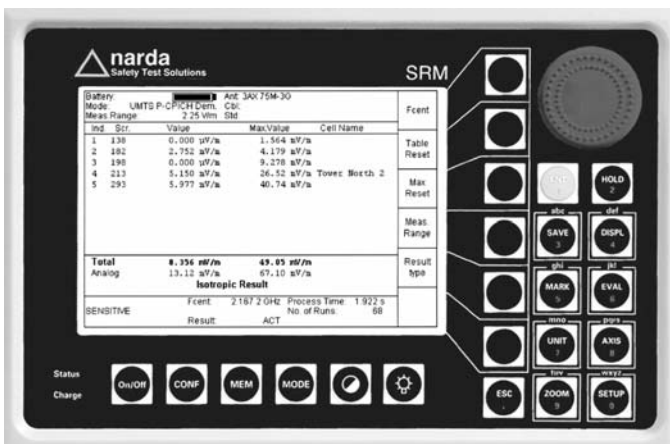

UMTS P-CPICH DEMODULATION (optional)

In UMTS P-CPICH Demodulation mode, the SRM can decode the primary common pilot channels (P-CPICH) of each UMTS cell detected in a 5 MHz UMTS frequency block.

The instrument provides the results in a table arranged according to the scrambling codes used to identify the various cells. The SRM displays the results as percentages of a limit value or as absolute values in V/m, A/m or W/m² and mW/cm². In addition to the sum of all the demodulated field strength results (Total), the SRM also determines the actual overall analog channel power level of the UMTS frequency block being evaluated.

The SRM simultaneously displays the current values (Value) and the maximum values that occurred for each cell since the last Max Reset.

UMTS channel selection is made by entering the center frequency or the corresponding channel number. For quick and easy identification of the various scrambling codes, user defined cell name tables can be selected, in which each scrambling code is assigned a user defined alphanumeric comment.

The UMTS P-CPICH Demodulation Option allows the SRM to decode all the pilot channels (P-CPICH) contained in a 5 MHz bandwidth UMTS frequency block and can thus correlate the measured field strengths to the respective pilot channels.

TIME ANALYSIS

In Time Analysis mode, the SRM measures the field strength values at a user-definable center frequency and with a selectable resolution bandwidth between 6.4 kHz and 6 MHz.

The measurement algorithm employed ensures that the measurement results are recorded, processed and saved in real time without any gaps (as determined by the sampling rate).

Either a peak value detector (PEAK) or an RMS detector can be selected in Time Analysis mode.

The current or "actual" value (ACT) or the maximum value (MAX) can be displayed numerically when the PEAK detector is used.

The average value (AVG) or maximum average value (MAX AVG) can additionally be determined and displayed numerically when the RMS detector is used. The averaging time can be set between 0.96 seconds and up to 30 minutes, which includes the "6-minute average" required by many standards.

The SRM uses channel filters with steep cutoff characteristics in Time Analysis mode, so that a specific service can be monitored over a period of time without being influenced by neighboring services.

In Time Analysis mode, the SRM measures one peak value or RMS value against time. Changes in the measured values over a period of time can be recorded in this way.

Specifications

Basic Unit SRM-3000		
Frequency Range		100 kHz to 3 GHz
Modes		Spectrum Analysis UMTS — P-CPICH Demodulation (optional) Safety Evaluation Time Analysis
RF Features		
Frequency	Resolution Bandwidths (RBW)	See specifications for each mode
	Phase Noise (SSB)	30 kHz carrier spacing < -85 dBc (1 Hz) 100 kHz carrier spacing < -105 dBc (1 Hz) 1 MHz carrier spacing < -120 dBc (1 Hz)
	Reference Frequency	Original Deviation < 1.5 ppm Aging < 0.5 ppm/year Thermal Drift < 2.0 ppm (within specified temperature range)
Amplitude	Measurement Range (MR) = upper limit of expected power level	-27 dBm to +23 dBm (in steps of 1 dB)
	Display Range	From noise floor up to +26 dBm
	Maximum RF Power	+30 dBm
	Maximum DC Voltage	50 V
	Intrinsic Noise	- 121 dBm for 1 kHz RBW, f>20 MHz and no RF attenuation
	RF Attenuation	0 to 50 dB in steps of 1 dB (coupled with measurement range)
	2nd Order Intermodulation Products	≤ - 57 dBc for two signals of level 9 dB below MR and a spectral line spacing of more than 100 kHz
	3rd Order Intermodulation Products	≤ - 70 dBc for two signals of level 9 dB below MR and a spectral line spacing of more than 500 kHz
	Level Measurement Uncertainty	< 1.1 dB for the frequency range 20 MHz to 3 GHz (within the temperature range from 15°C to 30°C)
	Spurious Responses (input-related)	< - 65 dBc or MR - 71 dB for signals with a level below MR - 6 dB (worst of both) < - 60 dBc for a carrier spacing of 72 MHz
	Spurious Responses (residual)	< - 104 dBm or MR-77 dB for frequencies above 20 MHz
	Units	dBm, dBV, dBmV, dBμV Field strength units available according to measurement antenna used (see under "Measurement Functions")
RF Input	Type	N Connector, 50 Ω
	Return Loss	< 11 dB for f ≤ 2.4 GHz

Spectrum Analysis Mode	
Resolution Bandwidths (-3 dB)	1 kHz to 5 MHz (in steps of 1, 2, 3, 5, 10) List of available RBWs depends on selected sweep SPAN
Sweep Time	200 ms to 1 s (depending on sweep span)
Filter Type Shape Factor (-3 dB / -60 dB)	Gauss Filter < 3.8 (for RBS ≤ 100 kHz)
Detection	Detection selected by Result Type: (AVG → RMS value; MAX → Peak value)
Result Type	ACT (display of current ["actual"] spectrum) MAX (Max Hold function) AVRG (averaging over a selectable number of spectra [4 to 64]) MAX AVRG (Max Hold function after averaging over the defined number of spectra)
Marker Functions	Highest peak, peak right, peak left, higher peak, lower peak Marker field (frequency, level and service name from selected service table)
Evaluation Functions	Peak Table (list of 50 highest peaks) Integration over a user-specified frequency range
Axis	Isotropic measurement (isotropic result displayed directly) Measurement of X-, Y- or Z- axis (separate measurement of a single axis using the isotropic antenna)
Display Functions	Y-scale range 20, 40, 60, 80 or 100 dB Y-scale reference - 47 dB to 43 dBm Full screen (enlarges the graph window to fill the entire screen area)
Zoom Functions	Zoom Min (adjusts left-hand frequency of zoom window) Zoom Max (adjusts right-hand frequency of zoom window) Move Zoom Area (moves adjusted zoom window over frequency) Reduce/Enlarge Zoom Area (scales zoom window size) Zoom to Marker (moves zoom area to actual marker position) Execute Zoom (sets Zoom Min to F min and Zoom Max to F max)
Safety Evaluation Mode	
Measurement Principle	Spectrum analysis, followed by integration over user-defined frequency bands ("Services")
Resolution Bandwidths (-3 dB)	Automatically set as a function of the narrowest user-defined service
Filter	See <i>Spectrum Analysis</i> mode
Detection	RMS (integration time = $\frac{1}{2 \times \text{RBW}}$)
Result Type	See <i>Spectrum Analysis</i> mode
Display	Tabular format with service names, field strength contribution, and frequency band (maximum three columns)

UMTS P-CPICH Demodulation Mode (optional)	
UMTS Channel Selection	By entering the center frequency By entering the channel number
Frequency Setting Resolution	100 kHz (for Fcent frequency entry) 0.5 x channel number (for channel entry)
Detection	RMS (integration time = 10 ms)
Filter Type Roll-Off Factor	Root-Raised Cosine (RRC) $\alpha = 0.22$
Selectable Units for P-CPICH	With Antenna: dBV/m, dBmV/m, dB μ V/m, dBA/m, A/m, mW/cm ² , W/m ² % of selected safety standard (based on power) Without Use of Antenna: dBm, dBV, dBmV, dB μ V
Possible Units for P-CPICH	dBV/m, dBmV/m, dB μ V/m, dBA/m, A/m, mW/cm ² , W/m ² % of selected safety standard (based on power) dBm, dBV, dBmV, dB μ V
Possible Result Types	Actual (ACT) and maximum (MAX) values displayed constantly Averaging selectable (on/off) for actual and max. values (averaged number selectable between 4 and 64)
Received / Demodulated Signal	P-CPICH
Display	Up to 16 scrambling codes simultaneously Table format with columns for Index, Scr. Code, Value, Max. Value, Cell Name Total sum of all ACT and MAX P-CPICH values Actual and Max. channel power User defined cell names (from cell name tables) Number of runs (sweeps) since last reset
Time Analysis Mode	
Measurement Principle	Selective level measurement at a fixed frequency
Detection	RMS (integration time = 480 ms) Peak
Filter Type	Steep cutoff channel filter
Resolution Bandwidth RBW (-6 dB)	6.4 kHz to 6 MHz
Trace Display (Result Type)	ACT (display of current ["actual"] spectrum) AVG (Time Averaging using RMS detector) MAX (Max Hold function) MAX AVG (Max Hold function after averaging over a defined number of spectra using RMS detector)
Time Averaging	Selectable from 0.96 seconds up to 30 minutes (0.96 s; 1.2 s; 2.4 s; 3.6 s; 6 s; 12 s; 18 s; 30 s; 1 min; 2 min; 3 min; 5 min; 6 min; 10 min; 15 min; 20 min; 30 min)

MEASUREMENT FUNCTIONS		
Field Strength Measurements	Detection of Narda Measurement Antennas	Automatic consideration of antenna parameters after antenna is plugged in: antenna type, serial number, calibration date, and antenna factors (see below) Automatic limitation of the frequency range according to the frequency range of the connected antenna.
	Antenna Factors	Used for display in field strength units Saved in all Narda antennas during calibration Ability to save 20 antenna factor lists for antennas from other manufacturers (these lists defined using the PC configuration software "SRM tools" included in delivery)
	Detection of Narda Cables	Automatic consideration of cable parameters after cable is plugged in: cable type, serial number, calibration date, and loss factors (see below) Automatic limitation of the frequency range according to the frequency range of the connected cable
	Cable Loss Factors	Used for compensation of the power level display Saved in all Narda cables during calibration Ability to save 20 cable loss lists for cables from other manufacturers (these lists defined using the PC configuration software "SRM tools" included in delivery)
	Units	V/m, A/m, W/m ² or mW/cm ² , dBV/m, dBA/m
RF Personal	Isotropic Measurements	Automatic switching of the antenna axes, when using Narda's triaxial measurement antenna, followed by computation of the isotropic result Support for sequential measurements, using single-axis antennas and computation of the isotropic result Both results are directly displayed as a spectrum curve or as numerical values
	Weighted Display	As % of the standard for the following personal safety standards: ICNIRP, IEEE, FCC, BGV B11, BImSchV, Safety Code 6 Updates after development of new personal safety standards, using the PC configuration software "SRM tools" included in delivery
	Correlation of Results with Telecom Services	Definition and editing of service tables in the PC configuration software "SRM tools," i.e., lists of frequency bands (upper and lower limit frequency, name for defined frequency band) Storage of up to 50 service tables in the basic unit Use of the service tables for automatic correlation of measurement results with defined services based on frequency (marker functions, peak table evaluation function, Safety Evaluation mode)
Setups		Up to 20 complete device configurations can be saved in the basic unit; up and downloadable using SRM tools software
Memory	Modes	Storage of current result: SPECTRUM in <i>Spectrum Analysis</i> mode, TABLE in <i>Safety Evaluation</i> mode Conditional storage of results when a threshold is violated (in all modes)
	Capacity	16 MB (32 MB from F Series) (up to 512 spectra in <i>Spectrum Analysis</i> mode or tables in <i>Safety Evaluation</i> Mode)

GENERAL SPECIFICATIONS		
Operating Temperature Range		-10°C to +50°C during normal operation 0°C to +40°C when charging
Air Humidity (Operating Range)		<29 g/m ³ (<93% at +30°C)
RF Immunity		200 V/m between 100 kHz and 3 GHz
Compliance	Climatic Storage Transport Operating	1K3 (IEC 60721-3) extended to -10°C to +50°C 2K4 (IEC 60721-3) 7K2 (IEC 60721-3)
	Mechanical Storage Transport Operating	1M2 (IEC 60721-3) 2M3 (IEC 60721-3) 7M3 (IEC 60721-3)
	ESD and EMC	EN 61326:2004
	Safety	EN 61010-1:2002
CE (European Community)		Yes
Weight		1.9 kg (including rechargeable cell)
Dimensions		255 mm x 195 mm x 60 mm
Display	Type	Monochrome, LCD (transflective) with backlighting for indoor or outdoor use
	Size, Resolution	115 mm x 80 mm , 480 x 320 pixels
Interface	Type	RS-232, electrical or optical (with additional accessory)
	Transfer Rate	115.2 k baud
Power Supply	Rechargeable Cell	Lithium-Ion cell / Typical 4 hour cell operating time / Charged using external power supply
	External Power Supply (12 V DC / 2.5 A)	AC/DC adapter Input: 100-240 V / 47-63 Hz / 700 mA
Calibration Interval		24 months recommended

Antenna Specifications

Antenna	Triaxial	Single Axis E-Field 3531/01	Single Axis E-Field 3531/02	Single Axis H-Field 3551/01
Frequency Range The correction factors determined individually during calibration are stored in an EEPROM and are applied automatically when used in conjunction with the SRM basic unit.	75 MHz to 3 GHz	27 MHz to 3 GHz	100 kHz to 300 MHz	100 kHz to 300 MHz
Antenna Type	E-field	E-field	E-field	H-field
Sensor Type	Triaxial design with scanned axes	Single axis passive wide band dipole	Single axis active broadband dipole	Single axis active magnetic loop
Dynamic Range^a	0.25 mV/m to 200 V/m	90 μ V/m to 80 V/m	125 μ V/m to 36 V/m	0.4 μ A/m to 71 mA/m
CW Damage Level	435 V/m or 50 mW/cm ²	> 300 V/m or 25 m W/cm ²	> 1000 V/m	> 2.65 A/m above 1 MHz
RF Connector	N connector, 50 Ω			
Operating Temperature Range	-10 °C to 50 °C			
Compliance	Climatic Storage^b	1K3 (IEC 60721-3)		
	Transport	2K4 (IEC 60721-3)		
	Operating	7K2 (IEC 60721-3)		
	Mechanical Storage	1M2 (IEC 60721-3)		
	Transport	2M3 (IEC 60721-3)		
	Operating	7M3 (IEC 60721-3)
